AB Ceramic materials are produced from **fly ash** and clays accompanying coal deposits. Clays are slurried with **water** and optional fluidity improver, the resulting suspension is stabilized by adding 0.1-8 weight%, organic **plasticizer(s)** and **fly ash** is added. The liquid phase/solid phase ratio in the suspension is <1:1. Then, the suspension is classified and spray dried. The resulting granules are pressed and used for manufacture of ceramics, building materials, and refractories. Thus, clay was slurried with warm **water** to obtain a .apprx.10 weight% suspension, and **water** glass fluidity improver and styrene-acrylic copolymer **plasticizer** were added. Then, **fly ash** was added to give a 60% suspension having a viscosity of 90 mPa-s. The suspension was passed through a sieve (0.5 mm mesh size), spray dried, and granulated. The bulk d. of the granules containing .apprx.5 weight% moisture was 9.8 + 10⁻⁴ kg/m³. Bending strength was 0.88 MPa after compacting at 20 MPa, 1.82 MPa after drying, and 38.8 MPa after **firing** at 1423 K. The absorption ability after **firing** was ≤2 weight%.
